Only closed loops contribute to the effective theory.

$$\hat{H}_{\text{eff}} = \sum_{l: \text{closed loops}} \hat{Q}(l) \sum_{d: \text{loop directions}} \sum_{s: \text{sequences}} a_l(s, d)$$

- \hat{Q} : Pauli word
- $a_l(s, d) \in \mathbb{C}$
- $a_l(s, d) \propto \frac{1}{E_c} |l|$

Short loops dominate the theory.
