

Lecture 4

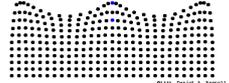

# Mechanical waves

Pre-reading: §15.1–15.2

## Mechanical Waves

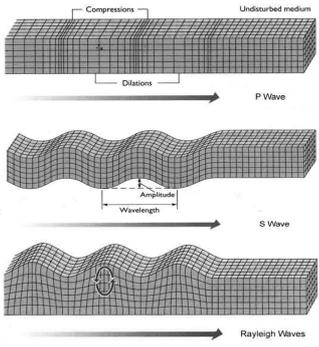

Transverse 

Longitudinal 

Trans. + Long. 

Figures courtesy D. Russell §15.1

## Types of earthquake waves

Compressions  
Undisturbed medium  
Dilations  
P Wave

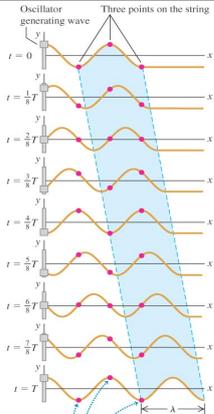

Amplitude  
Wavelength  
S Wave

Rayleigh Waves

## General Properties of Mechanical Waves

- Need to distinguish **medium** from **particles**
- shape of pattern (pulse, continuous, standing wave)
- speed of wave (or pattern)
- energy transmitted (related to amplitude)
- number of dimensions (rope; pond; speakers)

§15.2

Oscillator generating wave  
Three points on the string

$t = 0$   
 $t = \frac{1}{8}T$   
 $t = \frac{2}{8}T$   
 $t = \frac{3}{8}T$   
 $t = \frac{4}{8}T$   
 $t = \frac{5}{8}T$   
 $t = \frac{6}{8}T$   
 $t = \frac{7}{8}T$   
 $t = T$

$\lambda$

## Periodic Waves

- Created by continuous, sinusoidal pulses
- restoring force could be tension, pressure, etc.
- Characterised by
  - wavelength ( $\lambda$ ) or angular wavenumber ( $k$ )
  - period ( $T$ ) or frequency ( $f$ ) or ang. freq. ( $\omega$ )
- Speed of wave pattern is  $v = f\lambda = \omega/k$

§15.3

## Speed and wavelength

- Sound consists of longitudinal waves in air. At 20° C,  $v = 344 \text{ ms}^{-1}$ . What is the wavelength for middle C ( $f = 262 \text{ Hz}$ )?

## Next lecture

The wave equation
